

UAB Center for Palliative and Supportive Care

Safe Opioid Management for the Seriously Ill Patient

Sam Perna, D.O.

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

Objectives:

- 1) Participants will **understand** the way the body's pain system works. MDB1
- 2) Participants will identify the elements of a pain history. MDB5
- 3) Participants will recognize different types of pain. MDB2
- 4) Participants will differentiate the use of long acting vs. short acting opioids. MDB13

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

What is your Definition of Pain?

- **Nociception**: the process of detection of tissue injury or inflammation by the initiation and propagation of afferent neurotransmission
- **Pain**: an unpleasant sensory and emotional experience associated with actual or potential tissue damage or described in terms of such damage

Berde and Wolfe, J Pediatr 2003; 142: 361-3

UAB Children's of Alabama  **Aspire** HEALTH

Slide 2

- MDB1** Careful introducing new abbreviations without first defining them.
Michael David Barnett, 3/26/2013
- MDB2** What about age-appropriate dosing? The differences between opioid-naive dosing in neonates v. children v. teens v. adults? Differences in metabolism of opioids in different ages?
Michael David Barnett, 3/26/2013
- MDB5** Consider combining these two learning objectives since you teach them together later. E.g. "To list maximum blood concentrations (Cmax) and expected duration of opioids by route of administration."
Michael David Barnett, 3/26/2013
- MDB13** You list this as a learning objective...but I don't see where you convert between opioids in your cases? Do you show them how to use the conversion table?
Michael David Barnett, 3/26/2013

UAB Center for Palliative and Supportive Care

Nociception

The diagram illustrates the nociception pathway. On the left, a hammer is shown striking a red dot labeled 'Nociceptor'. An orange arrow points from the nociceptor to a blue dot labeled 'Peripheral Afferent Nerve Fiber'. From this fiber, a light blue line leads to the 'Spinal Cord', which is depicted as a vertical column of vertebrae. From the spinal cord, a line leads to the 'Brain', shown as a pink, textured mass at the top of the spinal column.

Types of Pain

- Important to know the etiology to choose the most effective therapy.
- Somatic Pain
- Visceral Pain
- Neuropathic Pain
- Acute vs. Chronic Pain

UAB Children's of Alabama Aspire HEALTH

UAB Center for Palliative and Supportive Care

Clinical Case

- Ashley is a 78yo female, with newly DX metastatic recurrent breast cancer.
- What questions do you ask about her pain?

• Irvin, W., et al. (2011). "Symptom management in metastatic breast cancer." *The oncologist* 16(9): 1203-1214.

UAB Children's of Alabama Aspire HEALTH

UAB Center for Palliative and Supportive Care

Taking a Pain History

- Intensity of pain (0-10)
- Location and quality of pain
- Precipitating and alleviating factors
- **Impact of pain on function**
- Other symptoms: Fever, Dyspnea, etc.
- Patient's History of Pain (if chronic)
 - Number of episodes of pain in the past year
 - Number of ER visits and hospital admissions
 - Current medication regimen
 - Similarity of present episode to previous episodes

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

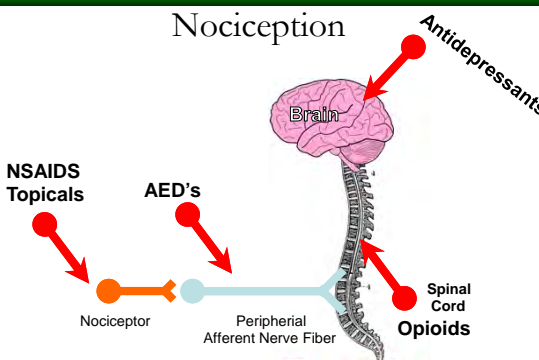

Physical Examination

- Heart Rate and Blood Pressure
- Oxygen Saturation and Respiratory Rate
 - CO₂ Monitors are better
- Temperature
- Site of Pain
 - Warmth, tenderness, swelling, erythema
- Additional organ systems and further testing

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

Nociception

The diagram illustrates the nociception pathway. It starts with a **Nociceptor** (represented by an orange dot) which sends signals through a **Peripheral Afferent Nerve Fiber** (represented by a blue line) to the **Spinal Cord** (represented by a grey vertical structure). From the spinal cord, signals go to the **Brain** (represented by a pink brain). Red arrows indicate the points of action for various medications: **NSAIDs Topicals** act on the **Nociceptor**; **AED's** (Antiepileptic Drugs) act on the **Peripheral Afferent Nerve Fiber**; **Opioids** act on the **Spinal Cord**; and **Antidepressants** act on the **Brain**.

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

- 78 yo female
- Acute onset pain 3 days ago
- Temp 101, HR = 150, BP = 125/80, Wt = 30kg
- Lumbar back pain;
- Sharp and constant 2/5 at rest
- 5/5 with movement
- Nothing makes better (Tylenol has not helped)
- Patient is very still laying in bed and trying not to move
- NKDA

UAB Children's of Alabama 

UAB Center for Palliative and Supportive Care **WHO 3-step Ladder**

± Adjuvants

1 mild

Acetaminophen
NSAIDs

Oral:

A/Hydrocodone
A/Oxycodone

Gedone
Morphine
Oxycodone

2 moderate

IV or SQ:

Morphine
Hydromorphone
Methadone
Fentanyl

3 severe

MDR14

UAB Children's of Alabama 

UAB Center for Palliative and Supportive Care

Safety–Pharmacology is KEY!

- Neonates & infants < 6mo:
- increased half-life and diminished clearance
- 30% starting dose reduction
- Dose intervals longer
- At a higher risk for respiratory depression.

UAB Children's of Alabama 

Slide 11

MDB14 Why not these three? Are you going to talk about why no codeine?

Michael David Barnett, 3/26/2013

UAB Center for Palliative and Supportive Care

Safety –Pharmacology is KEY!

- 6 months to 12 yrs:
- Increased clearance with normal volume of distribution
- Pediatric starting dose
- Dose intervals may be shorter

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

Safety –Pharmacology is KEY!

- >12 yrs and >50kg:
- Adult Dosing

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

Safety –Pharmacology is KEY!

- Precautions for Prescribers:
 - Risk of Adverse Events greatest when prescribing a new medication or when increasing the dose/frequency.

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

Safety –Pharmacology is KEY!

- Precautions for Prescribers:
 - Anaphylaxis
 - POTENTIAL Respiratory Effects:
 - Decreased Respiratory Rate
 - Decreased Tidal Volume
 - The above may cause impaired gas exchange: ie. hypercapnia and hypoxemia.

UAB Center for Palliative and Supportive Care

Safety –Pharmacology is KEY!

Morphine MDB4

Route	Cmax	Duration
IV		
SQ		
PO IR		
PO SR		

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

Routine oral dosing

immediate-release preparations

Adjust dose daily MDB7

- mild / moderate pain ↑ 25%–50%
- severe / uncontrolled pain ↑ 50%–100%

Adjust more quickly for severe uncontrolled pain

Adapted from EPEC

UAB Children's of Alabama  **Aspire** HEALTH

Slide 17

MDB4 But the table is for IV/SQ, IR & SR?
Michael David Barnett, 3/26/2013

Slide 18

MDB7 This doesn't come in a stand-alone product does it? (or at least not yet in US)?
Michael David Barnett, 3/26/2013

UAB Center for Palliative and Supportive Care

Opioids - Principles of Dosing

- Individualize dose by gradual escalation until development of adequate analgesia or intolerable and unmanageable side effects.
 - No therapeutic ceiling effect.
- “Around the clock dosing” for continuous or frequently recurring pain.
- As needed (“prn”) dosing for dose finding and for “rescue doses”.

Kochhar R, et al. Opioids in cancer pain: common dosing errors. *Oncology*. 2003; 17:571-9.

UAB Children's of Alabama

UAB Center for Palliative and Supportive Care

WHO Ladder

- For severe pain you would prescribe?
 - IV opioid
- For moderate pain you would prescribe?
 - PO opioid
- For mild pain you would prescribe?
 - Tylenol or NSAID

Kochhar R, et al. Opioids in cancer pain: common dosing errors. *Oncology*. 2003; 17:571-9.

UAB Children's of Alabama 

UAB Center for Palliative and Supportive Care

Rescue dosing

- Use immediate-release opioids
 - 5%–15% of 24-h dose
 - offer after Cmax reached
 - po / pr ≈ q 60 min
 - SC, IM ≈ q 30 min
 - IV ≈ q 15 min
- Why NOT use extended-release opioids for rescue?

Kochhar R, et al. Opioids in cancer pain: common dosing errors. *Oncology*. 2003; 17:571-9.

UAB Children's of Alabama 

UAB Center for Palliative and Supportive Care

Opioid Tapering

Customize to Patient need / condition

- Typical Taper: reduce dose by 25% daily and maintain schedule as tolerated.
 - Change to PRN dosing when pain no longer constant.
- Rapid Taper if no pain and too sleepy or abnormally low respiratory rate.

 Children's of Alabama 
Aspire
HEALTH

UAB Center for Palliative and Supportive Care

Narcan

- Birth to 5 years: 0.1mg/kg IV / IM q3 to 8 minutes prn until respiratory rate is normalized, the repeat q 2hrs PRN.
- 5 years or >20kg: 2mg IV / IM /SQ / IO / ETT q2 to 3 minutes prn until respiratory rate is normalized, the repeat q 2hrs PRN.
- Palliative Patient or chronic opioid patient:
 - Give 10% of above dose q 2 minutes and bag ventilate until respiratory rate is normalized.

HEALTH

UAB Center for Palliative and Supportive Care

DO NOT FORGET

- If frequent opioids, please do not forget to write the prescription for a
- SCHEDULED LAXATIVE !!!!
- Docusate
- Bisacodyl
- Miralax
- Sorbitol

UAB Children's of Alabama  **Aspire** HEALTH

UAB Center for Palliative and Supportive Care

CDC CLINICAL REMINDERS

- Use immediate-release opioids when starting
- Start low and go "smart"
- When opioids are needed for acute pain, prescribe no more than needed
- Do not prescribe ER/LA opioids for acute pain
- Follow-up and re-evaluate risk of harm; reduce dose or taper and discontinue if needed

<http://www.cdc.gov/drugoverdose/prescribing/guideline.html>
accessed 2016

2015 National Survey on Drug Use and Health (NSDUH).

- 37.8% of adults used prescription opioids;
- 4.7% misused them;
- 0.8% had a use disorder.

Han B, Compton WM, Blanco C, Crane E, Lee J, Jones CM. Prescription Opioid Use, Misuse, and Use Disorders in U.S. Adults: 2015 National Survey on Drug Use and Health. *Ann Intern Med.* [Epub ahead of print 1 August 2017] doi: 10.7326/M17-0865

Hope for the Future

PD-L1 plays an important role in the modulation of acute and chronic pain, which may lead to the development of more effective and safer treatments.

Chen G, Kim YH, Li H, et al. PD-L1 inhibits acute and chronic pain by suppressing nociceptive neuron activity via PD-1. *Nat Neurosci*. 2017;20(7):917-926.
